ABSTRACT

Disclosed is a method for drafting at least one sliver by means of a regulated spinning machine, particularly a carding machine or drawing frame. Pairs of rollers are disposed one behind another and upstream of which the cross section of the at least one sliver is measured. At least one roller of a first pair of rollers is triggered via a first regulating circuit while at least one roller of a second pair of rollers is triggered via a second regulating circuit based on the measuring signals. Also disclosed is a device for carrying out the inventive method.
